

National Severe Weather Warning Service

Chief Forecasters Assessment

Following a build of very warm and humid air there is the potential for further locally intense thunderstorms over the UK through the rest of today. In this situation large amounts of energy are available in the atmosphere and this coupled with high moisture content can lead to torrential downpours along with frequent lightning activity, large hail and locally strong gusts. In this situation many elements need to come together at the same time to form these thunderstorms and so there remains greater than usual uncertainty in their development.

The Met Office have issued a **Yellow Warning of Rain**

Valid from **11:45 on Sat, 19th Jul 2014** until **23:55 on Sat, 19th Jul 2014**

Areas of heavy, thundery showers will continue to move northwards across much of the UK though today. The details of these remains uncertain but where they do form some torrential downpours are possible with frequent lightning, large hail and locally strong gusts. Significant flooding is possible where these do occur from surface water as well as from small, fast responding watercourses. The frequent lightning, large hail and strong gusts could also be an additional hazard. Please see the separate Amber warning which highlights areas where the risk of disruption is considered greatest.

The public should be aware of the risk of disruption from any of these elements. This is an update to the warning issued yesterday, but keeping the broad areas at risk the same.
